

### Homework 5 Report

I pretty much always use brackets to edit my files. I think it is a good editor and it helps me by autocompleting the tags. I did not think that this assignment was too difficult and it did not take me a long time to understand jQuery. I thought it was pretty interesting and a little bit easier than using plain old JavaScript. jQuery makes it much easier to change contents of the html file and I like using `$('#element')` more than manipulating the DOM with the parent and child. I only tested my webpage on google chrome.

My list maker is pretty simple. One can add a title, move list items to a completed section, put the completed item back into the list, and clear all of the items in the deleted list. I think the most time consuming thing was making it so that one can change the name of the list. This was because when I was trying to do this, the new list name would also appear as a list item. After a little while I got it to work without any problems.

I used W3 Schools a lot to look up some things about jQuery and I think that it helped me learn quite a bit. I also used a template from Start Bootstrap to make sure that my assignment didn't look ugly. I decided on freelance because I like the way that one looks and I didn't have to use any dropdown menus. The example helped me know how to handle clicks, but besides that, I did not use it much. Overall I liked this assignment.
